

CTS 2.0

CTS is an enterprise Container Tracking System that produces the ability to track massive amounts of containers at corporate and customer locations.

CTS is a reimbursing investment that conserves expenditures by reducing the need for replacement containers. CTS has the ability with demurrage, to produce capital for your organization.

CTS maximizes efficiency in utilizing your container assets by keeping them in the supply chain, rather than accumulate at customer facilities unused and unfilled.

WHAT DOES CTS ACCOMPLISH?

- Gives management the knowledge and ability to move products from facilities that have an abundance of containers to facilities that are lacking.
- Provides management with technology that enhances employee actions and the ability to provide customers with current up to date information.
- Produces totals of all containers and separates them into specific groups by size, manufacturer, and current location.
- Illustrates how long a container has been inactive at any location.
- Enables the viewing of an individual container's life history.
- Allocates container's that are waiting for repair, out for repair, or are no longer useable.
- Requires customers to digitally sign via handheld before the containers can be released, holding them personally responsible.

CAN CTS BE EXPANDED TO SERVE OTHER AREAS OF OUR BUSINESS?

- The addition of the Production program alters CTS to CMS (Container Management System).
- CMS allows you to realize how long a product has been contained, how much, what type, and current ongoing totals according to individual customer.
- CMS data can be configured to share information with your current manufacturing and accounting system.
- Provides the ability to print receipts directly from the handheld using a portable printer.

HOW CTS WORKS...

Handheld

- All data is input using a portable handheld/barcode scanner with two specific and easy to understand programs.
- Each container is bound with a Identification number that is printed on CTS ID cards or RFID chip.

Tracking Reports

- Variety of detailed reports articulates information that has been collected into viewable and printable screens.
- Produces the amount of containers that are currently in inventory at your nationwide, regional, local distribution and manufacturing facilities.
- Reports are utilized by plant, branch, and executive management.
- Ability to choose a location or all, and view container quantity, make, model, any options, owner, and age.
- Articulates employee operations by listing date, time, location, and employee ID for each transaction.
- The knowledge of who has your containers and for how long.
- Individual container tracking and history.
